

## INTRODUCTION

EPA's LandGEM model for estimating landfill gas emission is not representative of the field measured methane emissions. The purpose of the study is to evaluate methane generation rate ( $k$ ) and potential methane generation capacity ( $L_o$ ) used in the LandGEM for estimating Landfill Gas (LFG) and methane generation, oxidation, and emissions and to develop an alternate baseline model for calculating methane generation that can be generalized and scaled.

## FLAWS IN LANDGEM MODEL

## BACK CALCULATION

## METHODOLOGY

### Data Collection

Evaluating EPA' Land GEM model's landfill methane emissions estimates by using various  $k$  and  $Lo$

Compare LandGEM model result of methane generation with actual field data

Back calculation of  $K$  and  $Lo$  and evaluation of efficiency from back calculation

Developing an alternative method for calculating landfill methane emissions.

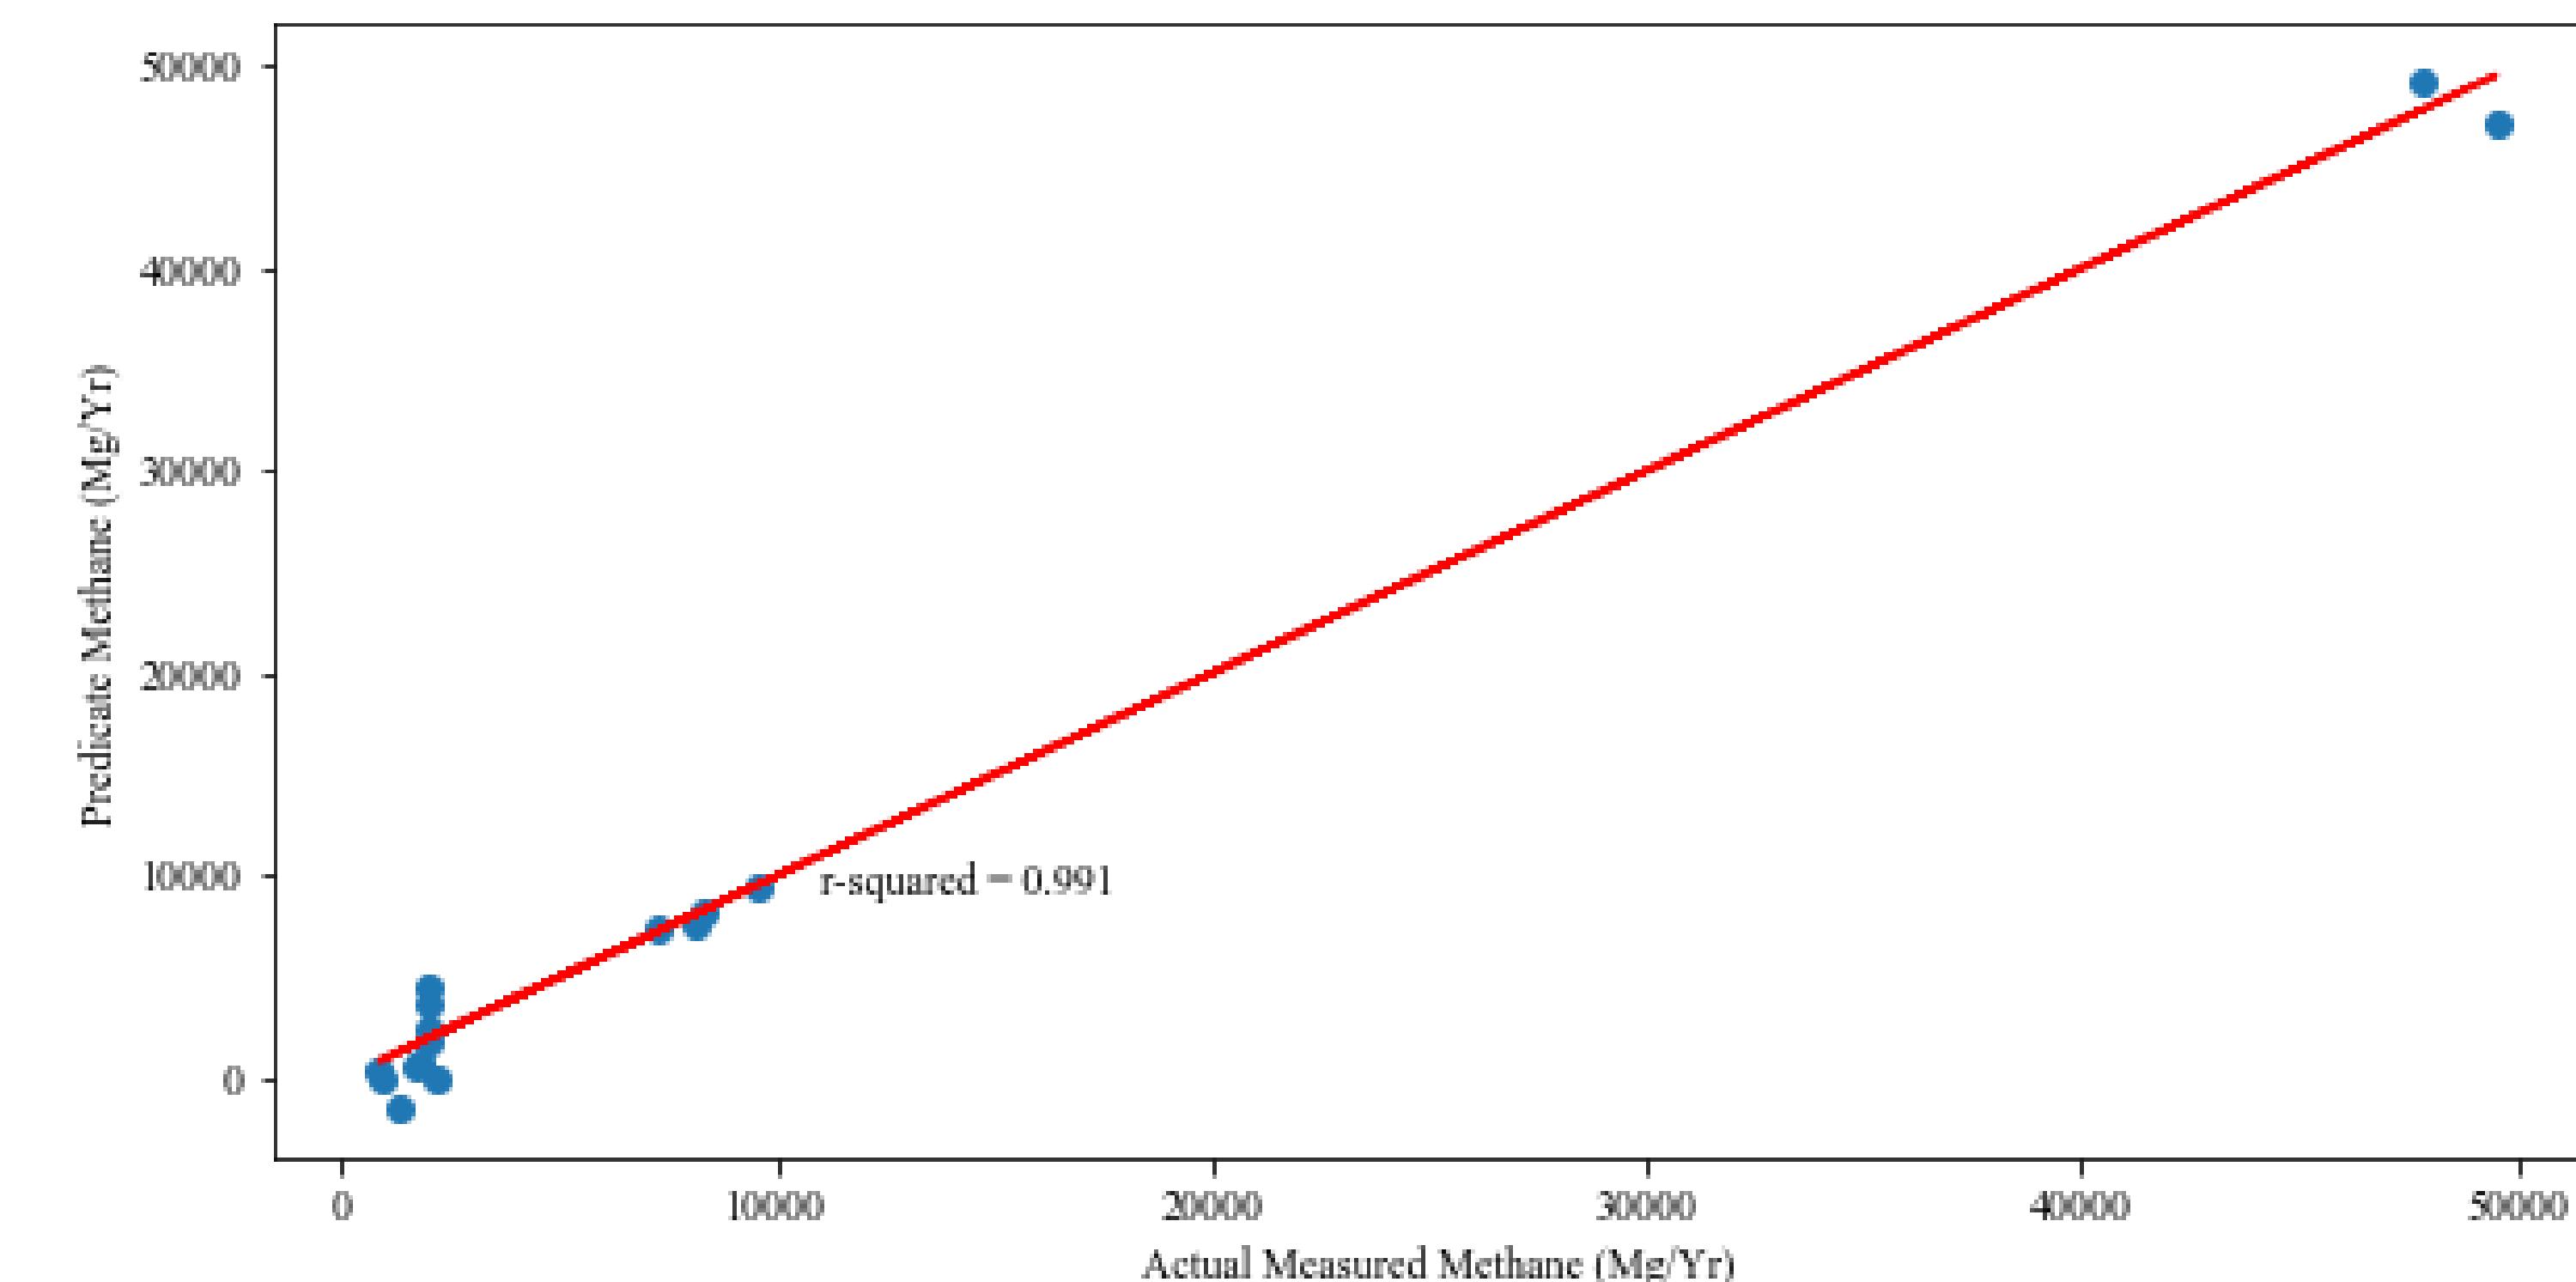

Landfill Name	Best results	Worst results
KING County Landfill ,WA	$k = 0.02 \& Lo = 170$	$k = 0.057 \& Lo = 102$
Ann Arbor, MI	$k = 0.057 \& Lo = 102$	$k = 0.02 \& Lo = 170$
Cathcart landfill, WA	$k = 0.057 \& Lo = 102$ (MRR dry)	$k = 0.05 \& Lo = 170$ (NSPS/CAA Wet)
Ridgeland, MS	$k = 0.02 \& Lo = 100$	$k = 0.05 \& Lo = 170$
Canton MS	$k = 0.057 \& Lo = 102$	$k = 0.02 \& Lo = 100$

## ALTERNATE MACHINE LEARNING MODEL

$$Q'_{CH_4} = 31475\alpha - 18180\beta - 914\gamma + 7354\delta - 221\theta + 17021$$

$Q'_{CH_4}$  = Methane generated (Mg/Yr)  $\alpha$  = Waste in place (Mg/yr) ;  $\beta$  = Organic Waste

Concentration (Mg/Yr);  $\gamma = k (yr^{-1})$  ;  $\delta = Lo (m^3/Mg)$ ;  $\theta = Avg Rainfall (m)$

LandGEM Model doesn't provide generalizations. Factors beyond wet and dry category  $k$ ,  $Lo$  and waste accumulation in play .Landfill gas collection efficiencies add to the problem. Organic Waste composition has significant impact on methane generation

## DISCUSSION & CONCLUSION
